Augmented Reality Navigation System for Commercial Spaces

Proposal

by

Arif Kharoti, Nicholas Orford-Williams, Hardik Ramesh,
Gabriel Sampaio Da Silva Diogo, Hamza Sheikh, Jonathan Tang
Software Projects – Group 14

Autumn 2018

Submitted in partial fulfillment for the degree of
Bachelor of Science in Computer Science

Abstract

Frustration and confusion are common emotions that are apparent at large shopping centres. After analysing recent studies, it is evident that shopping centres have a huge role to play in the overall retail experience. In order to provide greater value to both consumers and retailers, retail settings are being challenged to become smarter. One approach that is becoming increasingly recognised is mobile augmented reality apps. Many consumers have difficulties in locating the store which satisfies their needs. In this research, we endeavour to outline the market requirement of developing an application that allows for smart retail and describing how additional value is created to customers as well as benefiting retailers. It is proposed that the application will implement a 3D model of various shopping centres, featuring navigation functionality to assist users in finding their desired store.

Chapter 1

Concept Introduction & User Needs

The main concept for this project revolves around the use of augmented reality navigation on smartphones. Augmented reality (AR) is the superimposing of a computer-generated image onto a user's view of the real world [1]. This technology first came about in the 1960s [2] but has recently gained wide-spread consumer and media attention after the use of on Snapchat filters [3] and the 2016 game *Pokémon Go* for example. There have been many times where people get lost in unfamiliar spaces such as a museum, immersed by the culture around them, and their sense of direction. This project aims to tackle this issue by allowing users to restore their orientation by having a mobile platform to route users to their destination, using AR. The platform will use the device's camera to work out its surrounding, and will produce a highlighted line on the screen to their destination in real time.

This concept has various applications to other similar scenarios such as finding products in a supermarket, books in a library, or even valuable items that people own that can emit an electronic signal for it to be tracked down. Further, the concept could also use machine learning in identifying user's traits in places visited in a museum in order to give personalised recommendations at other similar exhibitions.

Chapter 2

Stakeholder Requirements

The main stakeholders are museum visitors and staff. After consulting with them, and potential users of the proposed application, we were able to gain a better understanding of what the apparent need was in the relative market regarding museums. Out of the 21 responses we received, 15 potential users admitted to visiting museums at least once a month. This shows that there is some level of frequency in their visits, and that there is something that can be offered to this group of people.

Since our concept principally considers the user of navigation in museums, when users were asked, "do you find yourself using the maps in the museum more than once?" - a very reassuring 100% of visitors had agreed that they did in fact refer to the maps around the museum more than once, some respondents going on to say that they referred to it over 10 times. However, these maps are not free; in most museums, including the Natural History Museum and the Science Museum in London, require a fee of £1 in order to have access to the paper maps.

This shows that there is an evident need for an accessible tool other than the maps around the museum in order to assist visitors' navigation around the museum. 18 of the respondents had agreed they would much rather prefer using their phone to navigate rather than the paper maps that are currently available to assist in their navigation around the museum. These responses that we received first-hand were very reassuring for us as developers, as it brings to light an evident need for these visitors to have access to an improved navigation solution.

Based on the stakeholder research, the project requirements are,

- navigate the user to an through the use of augmented reality
- to display navigational routes in real time
- calculate the shortest route to the user specified location
- work transferrably in other museums/commercial spaces

- contain accessibility features such as magnified text and inverted colours for example

Chapter 3

Prior Knowledge

Chapter 4

Design

4.1 The Importance of Design

Having a design process allows for more efficiency, and transparency when coming to design the application. It overcomes the risk of referring back to the drawing board when developing the application, setting in stone the main features, and functionality of the application.

4.2 The Unified Modeling Language

An effective design strategies was carried out through the implementation of the Unified Modeling Language (UML), a powerful standard for creating specifications of various parts of a software system.

Our implementation of a use case diagram outlined the different scenarios in which a user would function the application. (Figure 1. Another way UML was implemented was to further support, and refine the designing phase of the software development, through an activity diagram. (Figure 2).

The use case diagram represents the functional behaviour of the system in terms of goals (as defined in the stakeholder requirements) that can be fulfilled by the system. The activity diagram was designed to model the work flow of the system. One main reason that the activity diagram was essential was that these diagrams are normally easily comprehensible for both analysts, and stakeholders. By producing these models, we were able to have a clear understanding of what the application does, and enabled us, the developers, to visualise the application for the future.

4.3 Service Model

The following cases are born out of one important principle, convenience. The 'lost' use case, for example, comes from the user that could be lost for whatever reason. The service we would provide would be the quickest and most convenient solution to finding their destination, whether that be the exit or

a particular exhibition. The '**exploration**' case, would be more convenient with the museum, and all its exhibitions (along with brief descriptions) will be at the user's fingertips (instead of existing museum navigation options e.g. wall-maps or paper maps).

Model around two cases

The lost-case, and exploration-case has a virtually linear-stream of logic, and is as follows:

1. The user enters within the radius of an environment (museum) modelled by the service.
2. The user's location is picked up once they give use permission to.
3. The user picks their destination.
4. That location is then taken, and passed through an algorithm calculating the quickest route between the user's real-time location, and their destination.
5. The user is then displayed the route, and directed towards their destination via their camera.
6. The user is given curated suggestions on possible places they can go.

Chapter 5

Prototyping

5.1 Augmented Reality (AR) Libraries

In order to identify libraries that are good for implementing AR on mobile devices, we divided this prototyping into three platforms to explore them, and built a small AR application to find out how they help with the project.

Vuforia (Unity on Android)

Unity is a cross-platform game engine, and was used to test a simple AR camera application where the device's camera hovers an object/image, to display information about that object/image on the device. We used Vuforia, a software development kit (SDK) that enables recognition, and tracking of image targets, to build the application. This can be used for the exploration case in the use case model. Although, there is a limited amount of tools for locating user current location compared to Android.

ARKit (iOS)

We built a similar prototype to Unity on Apple's ARKit using Swift, which was easy to pick up. It was intuitive to implement AR features as there was detailed documentation but logging GPS data was harder compared to Android.

ARCore (Android)

ARCore was used to create a simple 3D model showing on a mobile device when its camera targets a flat surface. It is easier to log GPS location Android compared to Unity, and iOS. Although connecting the user interface to the scripts was more challenging than iOS.

5.2 UI/UX Designs

Chapter 6

Functional Specification

Functional specification describes the important technical requirements for a system. It also includes the procedures in which the requirements have been met.

In this section, we are breaking down the functional specifications of our idea and how it should respond to a given task:

1. The system should extract the user's current location and their destination, this is key as it allows the app to calculate the route.
2. Then it'll calculate the most efficient route to a given exhibition in a desirably short period of time.
3. Therefore giving the display function the ability to superimpose a 3D line (over their camera) that navigates the user towards their destination.
4. Once their destination's been reached, the system will recognise this and the ability to review/rate the journey (and the app if they haven't done so yet) will be available. Along with this, the user will be shown a number of other possible options and exhibitions they can possibly wonder towards.

Chapter 7

Technical Architecture

Means of Software Development

IDE : Android Studio

The Android Studio is the only development IDE we'll be utilising because it involves a number of relevant exclusive packages and libraries - that if we were to use other IDEs, would have to be defined and therefore take valuable time from our development of the application itself.

Languages : Java & SQL

- Java is distinctly imperative to the project due to the fact that android app development is almost only possible in this language.

Architectural Pattern : MVC (Model-View-Controller)

Our application fits under the MVC pattern perfectly because it is that the following are true.

- Model = The data provided by the user (example : geolocal data)
- View = The front-end interface (example : 3D line to location)
- Controller = The algorithms between M&V (example : route calculation)

Along with the fact above, the pattern's simplicity makes the most sensible one we can use.

SDKs & Packages : ARCore

- The ARCore kit by Google gives us the ability to apply the AR element of our application without having to spend time pre-defining AR methods ourselves.

Technicalities of satisfying user-related questions and stories

Chapter 8

System Requirements Specification

Chapter 9

Ethical Audit

AR is currently not heavily regulated in the UK owing to the emergence of this new technology. It should be noted that AR will involve collecting extensive amounts of data per user such as names and address, but also real time location, interactions with other users. Within the scope of this project, we will not be working with minors and vulnerable adults. Since the concept of the project relies on the user's camera, accelerometer, and GPS on the user's device, ensuring this data cannot be obtained unlawfully, fitting the scope of the Data Protection Act (1998), and the General Data Protection Regulation (GDPR) is of most importance.[4]

Based on large virtual reality companies such as Oculus, these obligations are addressed by the form of a privacy policy, to detail how data is collected, used and if it is shared with third parties. It is critical these regulatory issues are addressed before the completion of the product and not after.

Another regulatory standard is the IP of the software. The source code that serves as the underlying foundation of the platform will be original and qualify for copyright protection. Since computer software is usually excluded from patentability in the UK, any ideas that uses AR producing a technical effect, and its associated hardware can be protected by patents. Based on our competitors, it is important that we do not infringe on their patents owned by third parties.

Equally, if the concept makes new technical developments in the AR field, then it should be considered whether it would be eligible for patent protection. The project could take on a machine learning viewpoint by recognising artworks captured on the user's camera. This could cause an infringement claim since AR could be replicating, replacing trademark or copyright works, or distorting the artwork.

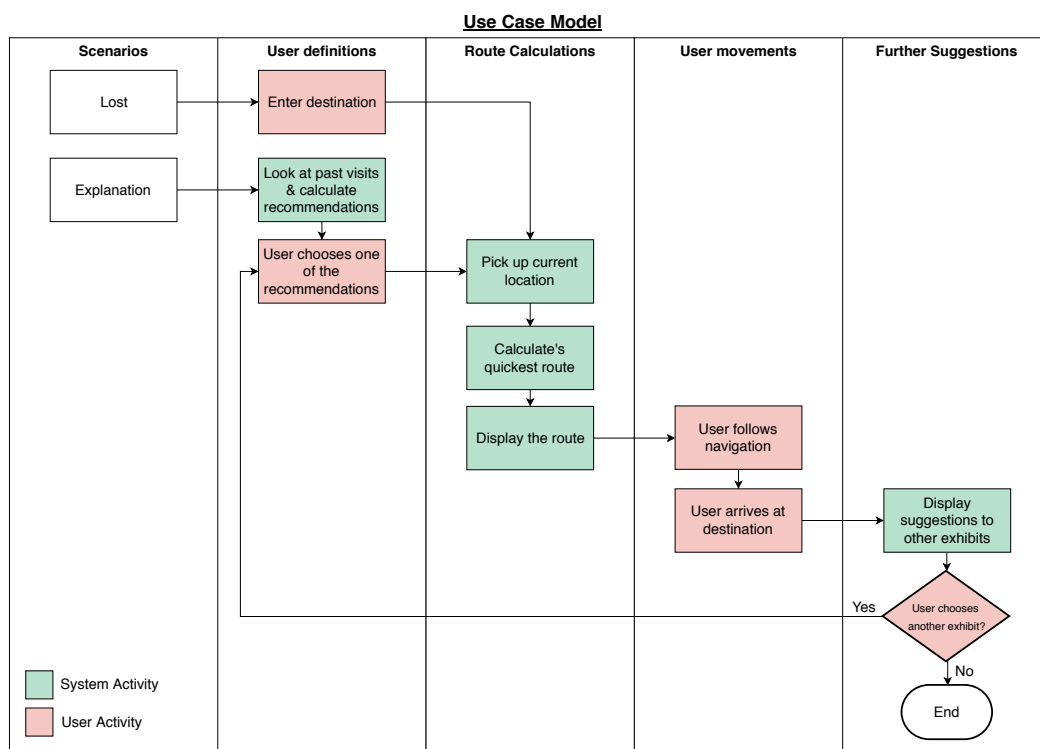

Figure 1: Use Case Diagram

Activity Model Diagram

Figure 2: Activity Model Diagram

Appendix A

Minutes

Week 1

Thursday 4 October 2018

- Meeting all team members
- Discussing potential concepts

Week 2

Monday 8 October 2018

- Reviewing potential concepts discussed
-

Thursday 11 October 2018

- Updating project tracking form
- Reviewing project concept

Friday 12 October 2018

-

Week 3

Monday 15 October 2018

- Creating scrum board to track tasks

Thursday 18 October 2018

- Updating project tracking form
- Reviewing market research
- Reviewing questionnaire

Friday 19 October 2018

-

Week 4

Monday 22 October 2018

-

Thursday 25 October 2018

- Updating project tracking form
- Reviewing use sequence model
- Reviewing activity model
- Reviewing service model

Friday 26 October 2018

-

Week 5

Monday 29 October 2018

- Allocating storyboard
- Creating outline for proposal
- Allocating gantt chart
-

Thursday 1 November 2018

- Updating project tracking form
- Reviewing storyboard

Friday 2 November 2018

-

Week 6

Monday 12 November 2018

-

Thursday 15 November 2018

- Updating project tracking form

Friday 16 November 2018

-

Week 7

Monday 19 November 2018

- Reviewing research on Android/iOS platform
- Reviewing individual UI/UX prototypes

Thursday 22 November 2018

- Updating project tracking form
- Review final android prototype
- Review final UX/UI prototype

Friday 23 November 2018

- Presentation on everything completed so far to project supervisor

Week 8

Monday 26 November 2018

- Allocating backlog
- Allocating open questions
- Allocating MVC
- Reviewing functional specification chapter

Thursday 29 November 2018

- Updating project tracking for
- Reviewing backlog
- Reviewing open questions so far
- Reviewing design chapter

Friday 30 November 2018

-

Week 9

Monday 3 December 2018

- Reviewing backlog, open questions, and MVC
- Reallocating chapters 5, 6, 7, 8 of proposal due to change in guidelines
- Reallocating user stories
- Preparation for concept presentation

Thursday 6 December 2018

- Updating project tracking form

Friday 7 December 2018

-

Week 10

Monday 10 December 2018

-

Wednesday 12 December 2018

- Proof reading all chapters
- Writing abstract and conclusion
- Completion of meeting minutes
- Submission of proposal
